Recreational water quality has been monitored in the Hunter region since 1996 by Hunter Water Corporation as a requirement of Environment Protection Licences. This report summarises the performance of 17 ocean beaches in the Hunter region of New South Wales, providing a long-term assessment of how suitable a site is for swimming.

In 2022–2023, 100% of swimming sites in the Hunter region were graded as Good or Very Good. These sites were suitable for swimming for most or almost all of the time. This is an excellent result, similar in performance to the previous year.

# Hunter region summary 2022–2023

## Monitoring water quality for swimming in New South Wales

Swanssea Heads Little Beach

Photo: Beachwatch/DPE

The water quality of beaches and other swimming locations is monitored under the NSW Government’s Beachwatch programs to provide the community with accurate information on the cleanliness of the water and to enable individuals to make informed decisions about where and when to swim. Routine assessment also measures the impact of pollution sources, enables the effectiveness of stormwater and wastewater management practices to be assessed and highlights areas where further work is needed.

Swimming sites in New South Wales are graded as Very Good, Good, Fair, Poor or Very Poor in accordance with the National Health and Medical Research Council’s 2008 *Guidelines for Managing Risks in Recreational Waters*. These Beach Suitability Grades provide a long-term assessment of how suitable a beach is for swimming. The grades are determined from the most recent 100 water quality results (2–4 years’ worth of data depending on the sampling frequency) and a risk assessment of potential pollution sources.

See the section on **Quality assurance** in the Statewide Summary for results of the quality assurance program.

Recreational water quality has been monitored in the Hunter region by Hunter Water Corporation since 1996.

A **quality assurance** program ensures the information collected and reported by Beachwatch and its partners is accurate and reliable.

## Rainfall impacts

During 2022–2023, 17 ocean beaches were monitored in the Hunter region.

Rainfall is the major driver of pollution to recreational waters, generating stormwater runoff and triggering untreated discharges from the wastewater treatment and transport systems. Changes in rainfall patterns are reflected in beach water quality over time due to variation in the frequency and extent of stormwater and wastewater inputs.

The Beach Suitability Grades for 2022–2023 are based on water quality data collected over the last 2–4 years. Rainfall over this period has been diverse:

- 2019–2020: average to below average rainfall, except for a wet February and a few isolated rain events
- 2020–2021: variable rainfall with some very wet months
- 2021–2022: average to below average rainfall, except for some wet months, including a very wet March and associated flooding
- 2022–2023: prolonged dry weather periods broken by heavy rainfall at times, and a very wet July.

See the section on **How to read this report** on page 31 for an explanation of the graphs, tables and Beach Suitability Grades.

Heavy rain fell on the Hunter Coast during July 2022. Monthly rainfall totals were well above the long-term average with heavy rain events occurring early in the month. Nelson Bay received 367 mm, Nobbys Beach (Newcastle) 247 mm and Swansea 346 mm of rainfall for the month, being the wettest July on record. Dry conditions returned in August 2022 with mostly average to below average rainfall recorded during the month.

Wet conditions returned in September and October 2022 with rainfall totals being average to above the long-term average in the region. Heavy rainfall was recorded in Swansea on 9 October with a daily total of 57 mm. A prolonged dry period was experienced during November 2022 with monthly rainfall well below the long-term average for the month.

The Hunter Coast received average to below average rainfall during summer. The dry weather periods were broken by heavy rainfall at times. Significant rainfall events in February resulted in daily rainfall totals of 65 mm in Swansea and 60 mm in Nelson Bay.

Wet weather conditions returned in March and April 2023 with average to above average rainfall recorded. An extended dry weather period at the beginning of March was broken by very heavy rainfall with Swansea recording a daily rainfall total of 53 mm.

## Marine algal blooms

Marine algal bloom present in the water

Photo: Chad Weston/NPWS, DPE

Water NSW issued a caution alert on the Hunter Coast for *Alexandrium pacificum*, from October to December 2022. Water NSW also issued a caution alert for *Trichodesmium* sp. in March 2023, which may have impacted beaches in the Hunter region. Marine algae advisories were issued on the Water NSW website.

The appearance of **marine algae** is sometimes mistaken for **sewage contamination** or **oil slicks**, due to a strong odour and red or brown discolouration in the water caused by the blooms.

As a precaution, direct contact with algae should be avoided as it can cause skin and eye irritations. The marine algal blooms dissipated with changes in tide and wind conditions.

Beachwatch issues daily **beach pollution forecasts** to enable beach goers to make informed decisions about where and when to swim.

Pollution forecasts for the Hunter beaches can be accessed via the Beachwatch website, email subscription, Twitter and Facebook.

### Health risks

Contamination of recreational waters with faecal material from animal and human sources can pose significant health problems to beach users owing to the presence of pathogens (disease-causing microorganisms) in the faecal material. The most common groups of pathogens found in recreational waters are bacteria, protozoans and viruses.

Exposure to contaminated water can cause gastroenteritis, with symptoms including vomiting, diarrhoea, stomach-ache, nausea, headache and fever. Eye, ear, skin and upper respiratory tract infections can also be contracted when pathogens come into contact with small breaks and tears in the skin or ruptures of the delicate membranes in the ear or nose.

Certain groups of users may be more vulnerable to microbial infection than others. Children, the elderly, people with compromised immune systems, tourists, and people from culturally and linguistically diverse backgrounds are generally most at risk.

## Overall results

All 4 swimming sites were graded as Very Good or Good in 2022–2023. This is an excellent result, and similar to previous years.

### Percentage of sites graded as Very Good or Good

	2020–2021	2021–2022	2022–2023	Trend
Ocean beaches (4 sites)	100%	100%	<b>100%</b>	—————

Four swimming sites were monitored in the Port Stephens local government area. All locations were monitored by Hunter Water Corporation as a requirement of Environment Protection Licences. Samples were collected every sixth day throughout the year.

See the section on **How to read this report** on page 31 for an explanation of the graphs, tables and Beach Suitability Grades.

### Best beaches

Zenith Beach, Box Beach, Fingal Beach and One Mile Beach.

These sites had excellent water quality and were suitable for swimming almost all of the time.

Ocean beaches were the only site type monitored in the Port Stephens region.

As a general precaution swimming should be avoided during and for at least one day after heavy rain at ocean beaches, or if there are signs of stormwater pollution such as discoloured water or floating debris.

Site types in Port Stephens Council

## Ocean beaches

**Beach Suitability Grades for Port Stephens Council ocean beaches**

All 4 ocean beaches were graded as Very Good in 2022–2023: Zenith Beach, Box Beach, Fingal Beach and One Mile Beach. Water quality at these sites has continued to be of a high standard and was suitable for swimming almost all of the time.

Fingal Beach was upgraded to Very Good from Good in the previous year, due to improved microbial water quality.

Swimming should be avoided for one day after rainfall at ocean beaches, or if signs of pollution are present such as discoloured water or flowing stormwater drains.

**Sampling sites and Beach Suitability Grades in Port Stephens Council**

# Zenith Beach

Beach grade: **VG**

Zenith Beach is 400 m long and is within Tomaree National Park. The beach is not patrolled by lifeguards.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with very few potential sources of faecal contamination.

Enterococci levels had little response to rainfall and generally remained below the safe swimming limit across most rainfall categories.

See 'How to read this report' for key to map. The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Sep 2021 to Apr 2023	96%	100	Stable

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# Box Beach

Beach grade:

Box Beach is 350 m long and within Tomaree National Park. The beach is not patrolled by lifeguards.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with only one potential source of faecal contamination.

Enterococci levels had very little response to rainfall and generally remained below the safe swimming limit across most rainfall categories.

See 'How to read this report' for key to map. The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Sep 2021 to Apr 2023	98%	100	Stable

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# Fingal Beach

**Beach grade:** VG

Fingal Beach is approximately 2.7 km long and within Fingal Bay. The beach is patrolled from September to April.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with very few potential sources of faecal contamination.

Enterococci levels increased slightly with increasing rainfall, occasionally exceeding the safe swimming limit after light rain.

See 'How to read this report' for key to map. The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Sep 2021 to Apr 2023	100%	100	Improved

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# One Mile Beach

Beach grade: **VG**

This 1.3 km stretch of beach is at the southern end of Anna Bay and is patrolled from September to April.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with few potential sources of faecal contamination.

Enterococci levels increased slightly with increasing rainfall, but generally remained below the safe swimming limit across all rainfall categories.

See 'How to read this report' for key to map.

The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Sep 2021 to Apr 2023	96%	100	Stable

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# City of Newcastle Council

## Overall results

All 7 swimming sites were graded as Very Good or Good in 2022–2023. Excellent results have also been recorded in previous years.

### Percentage of sites graded as Very Good or Good

	2020–2021	2021–2022	2022–2023	Trend
Ocean beaches (7 sites)	100%	100%	100%	—————

Seven swimming sites were monitored in the Newcastle local government area. All locations were monitored by Hunter Water Corporation as a requirement of Environment Protection Licences. Samples were collected every sixth day throughout the year and every third day during the swimming season at 4 sites.

See the section on **How to read this report** on page 31 for an explanation of the graphs, tables and Beach Suitability Grades.

### Best beaches

Stockton Beach, Nobbys Beach, Newcastle Beach, Bar Beach, Merewether Beach, Burwood North Beach and Burwood South Beach.

These sites had excellent water quality and were suitable for swimming almost all of the time.

Ocean beaches were the only site type monitored in the Newcastle region.

As a general precaution swimming should be avoided during and for at least one day after heavy rain at ocean beaches, or if there are signs of stormwater pollution such as discoloured water or floating debris.

Site types in City of Newcastle Council

## Ocean beaches

**Beach Suitability Grades for  
City of Newcastle Council  
ocean beaches**

All 7 ocean beaches were graded as Very Good in 2022–2023: Stockton Beach, Nobbys Beach, Newcastle Beach, Bar Beach, Merewether Beach, Burwood North Beach and Burwood South Beach. Stockton Beach improved to Very Good from Good in the previous year. Water quality at these sites was suitable for swimming almost all of the time and has been of a high standard for many years.

Swimming should be avoided for one day after rainfall at ocean beaches, or if signs of pollution are present such as discoloured water or flowing stormwater drains.

Sampling sites and Beach Suitability Grades in City of Newcastle Council

# Stockton Beach

Beach grade: **VG**

Stockton Beach is at the southern end of a 32 km stretch of beach and is patrolled from September to April.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with few potential sources of faecal contamination.

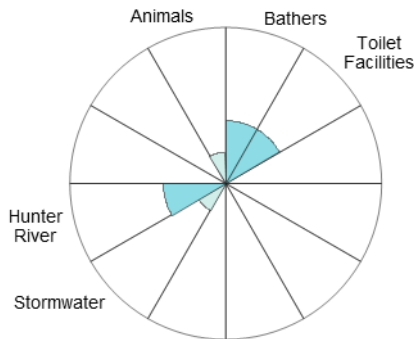

Enterococci levels increased slightly with increasing rainfall, occasionally exceeding the safe swimming limit after light rain.

The site has been monitored since 1996.

See 'How to read this report' for key to map.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Sep 2021 to Apr 2023	98%	100	Improved

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# Nobbys Beach

Beach grade: **VG**

Nobbys Beach is 1 km long and is patrolled year round.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with few potential sources of faecal contamination.

Enterococci levels increased slightly with increasing rainfall, occasionally exceeding the safe swimming limit after 20 mm or more of rain.

The site has been monitored since 1996.

See 'How to read this report' for key to map.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Sep 2021 to Apr 2023	100%	100	Stable

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# Newcastle Beach

Beach grade: **VG**

Newcastle Beach is approximately 650 m long and is patrolled from September to April.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with few potential sources of faecal contamination.

Enterococci levels increased slightly with increasing rainfall, occasionally exceeding the safe swimming limit after 20 mm or more of rain.

The site has been monitored since 1996.

See 'How to read this report' for key to map.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# Bar Beach

Beach grade: **VG**

Bar Beach is approximately 500 m long and is patrolled all year round.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with few potential sources of faecal contamination.

Enterococci levels generally increased with increasing rainfall, occasionally exceeding the safe swimming limit in response to 5 mm or more of rain, and often after 20 mm or more.

See 'How to read this report' for key to map. The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Apr 2022 to Apr 2023	98%	100	Stable

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# Merewether Beach

**Beach grade:** VG

Merewether Beach is at the southern end of a 900 m stretch of beach and is patrolled year round.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time with few potential sources of faecal contamination.

Enterococci levels generally increased with increasing rainfall, occasionally exceeding the safe swimming limit after 5 mm of rain, and often after 20 mm or more.

See 'How to read this report' for key to map. The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Apr 2022 to Apr 2023	99%	100	Stable <span style="border: 1px solid black; border-radius: 50%; width: 15px; height: 15px; display: inline-block; vertical-align: middle;"></span>

# Lake Macquarie City Council

## Overall results

All 6 swimming sites were graded as Very Good or Good in 2022–2023. This is an excellent result and consistent with the previous year.

### Percentage of sites graded as Very Good or Good

	2020–2021	2021–2022	2022–2023	Trend
Ocean beaches (6 sites)	100%	100%	100%	—————

Six swimming sites were monitored in the Lake Macquarie local government area.

All locations were monitored by Hunter Water Corporation as a requirement of Environment Protection Licences. Samples were collected every sixth day throughout the year.

See the section on **How to read this report** on page 31 for an explanation of the graphs, tables and Beach Suitability Grades.

### Best beaches

Glenrock Lagoon Beach, Dudley Beach, Redhead Beach, Blacksmiths Beach and Caves Beach.

These sites had excellent water quality and were suitable for swimming almost all of the time.

Ocean beaches were the only site type monitored in the Lake Macquarie region.

As a general precaution swimming should be avoided during and for at least one day after heavy rain at ocean beaches, or if there are signs of stormwater pollution such as discoloured water or floating debris.

Site types in Lake Macquarie City Council

## Ocean beaches

**Beach Suitability Grades for Lake Macquarie City Council ocean beaches**

Five of the 6 ocean beaches were graded as Very Good in 2022–2023: Glenrock Lagoon Beach, Dudley Beach, Redhead Beach, Blacksmiths Beach and Caves Beach. The water quality at these beaches is suitable for swimming almost all of the time.

Swansea Heads Little Beach continued to be graded Good in 2022–2023, consistent with the previous year. While the water quality was suitable for swimming during dry weather conditions, with 100% of dry weather samples within the safe swimming limit, elevated levels often exceeded the safe swimming limit following light rainfall.

Microbial water quality has generally been more elevated at Swansea Heads Little Beach in comparison to nearby beaches for the last 5 years. This beach is located at the entrance to Lake Macquarie in a 100 m long bay bordered by a rock platform and breakwall, which may reduce flushing and dilution of contaminants compared to other nearby open ocean beaches.

Swimming should be avoided for one day after rainfall at ocean beaches, or if signs of pollution are present such as discoloured water or flowing stormwater drains.

Sampling sites and Beach Suitability Grades in Lake Macquarie City Council

# Glenrock Lagoon Beach

**Beach grade:**

Glenrock Lagoon Beach is 300 m long and is located at the southern end of Burwood Beach. The beach is not patrolled by lifeguards.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered safe for swimming almost all of the time, with few potential sources of faecal contamination.

Enterococci levels increased with increasing rainfall, occasionally exceeding the safe swimming limit after light rain, and after 20 mm or more of rain.

See 'How to read this report' for key to map.

The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Sep 2021 to Apr 2023	100%	100	Stable

## Sanitary inspection: Low

## Microbial Assessment Category: A

## Dry and wet weather water quality

## Water quality in response to rainfall

# Dudley Beach

Beach grade: **VG**

Dudley Beach is 1 km long and is not patrolled by lifeguards.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered safe for swimming almost all of the time, with few potential sources of faecal contamination.

Enterococci levels increased slightly with increasing rainfall, occasionally exceeding the safe swimming limit in response to 20 mm or more of rain.

See 'How to read this report' for key to map. The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Sep 2021 to Apr 2023	100%	100	Stable

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# Redhead Beach

**Beach grade:** VG

Redhead Beach is located at the northern end of a 10 km stretch of beach and is patrolled between September and April.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with few potential sources of faecal contamination.

Enterococci levels generally increased with increasing rainfall, occasionally exceeding the safe swimming limit after light rain.

See 'How to read this report' for key to map. The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status	
Ocean beach	Sep 2021 to Apr 2023	98%	100	Stable	<span style="border: 1px solid black; border-radius: 50%; width: 15px; height: 15px; display: inline-block;"></span>

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# Blacksmiths Beach

Beach grade: **VG**

Blacksmiths Beach is at the southern end of a 10 km stretch of beach and is patrolled between September and April.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with few potential sources of faecal contamination.

Enterococci levels increased slightly with increasing rainfall, occasionally exceeding the safe swimming limit in response to 20 mm or more of rain.

See 'How to read this report' for key to map.

The site has been monitored since 1996.

Ocean beach	Sep 2021 to Apr 2023	100%	100	Stable

### Sanitary inspection: Low

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# Swansea Heads Little Beach

**Beach grade:** G

See 'How to read this report' for key to map.

Swansea Heads Little Beach is 60 m long and located on the southern side of the entrance to Lake Macquarie. The beach is patrolled from September to April.

The Beach Suitability Grade of Good indicates microbial water quality is considered suitable for swimming most of the time but can be susceptible to pollution after heavy rain, with several potential sources of faecal contamination including outflow from Lake Macquarie.

Enterococci levels increased slightly with increasing rainfall, occasionally exceeding the safe swimming limit after no rain, and often after light rain.

The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Sep 2021 to Apr 2023	100%	100	Stable <span style="border: 1px solid black; border-radius: 50%; width: 15px; height: 15px; display: inline-block; vertical-align: middle;"></span>

### Sanitary inspection: Moderate

### Microbial Assessment Category: A

### Dry and wet weather water quality

### Water quality in response to rainfall

# Caves Beach

**Beach grade:** VG

Caves Beach is located at the southern end of a 1.8 km beach and is patrolled between September and April.

The Beach Suitability Grade of Very Good indicates microbial water quality is considered suitable for swimming almost all of the time, with few potential sources of significant faecal contamination.

Enterococci levels increased slightly with increasing rainfall, occasionally exceeding the safe swimming limit after 20 mm or more of rain.

See 'How to read this report' for key to map. The site has been monitored since 1996.

Site type	Assessment period	Dry weather samples suitable for swimming	Water samples	Beach grade status
Ocean beach	Sep 2021 to Apr 2023	100%	100	Stable <span style="border: 1px solid black; border-radius: 50%; width: 15px; height: 15px; display: inline-block; vertical-align: middle;"></span>

# How to read this report

## Beach Suitability Grades

Beach Suitability Grades provide an assessment of the suitability of a swimming location for recreation over time and are based on a combination of sanitary inspection (identification and rating of potential pollution sources at a beach) and microbial assessment (water quality measurements gathered over previous years). There are 5 grades ranging from Very Good to Very Poor:

### Very Good

Location has generally excellent microbial water quality and very few potential sources of faecal pollution. Water is considered suitable for swimming almost all of the time

### Good

Location has generally good microbial water quality and water is considered suitable for swimming most of the time. Swimming should be avoided during and for up to one day following heavy rain at ocean beaches and up to 3 days at estuarine sites

### Fair

Microbial water quality is generally suitable for swimming, but because of the presence of significant sources of faecal contamination, extra care should be taken to avoid swimming during and for up to 3 days following rainfall or if there are signs of pollution such as discoloured water or odour or debris in the water

### Poor

Location is susceptible to faecal pollution and microbial water quality is not always suitable for swimming. During dry weather conditions, ensure that the swimming location is free of signs of pollution, such as discoloured water, odour or debris in the water, and avoid swimming at all times during and for up to 3 days following rainfall

### Very Poor

Location is very susceptible to faecal pollution and microbial water quality may often be unsuitable for swimming. It is generally recommended to avoid swimming at these sites almost all of the time

Some of the Beach Suitability Grades in this report are **provisional**, as the information required for the analysis is incomplete due to limited bacterial data or limited information on potential pollution sources in a beach catchment.

### The guidelines

The National Health and Medical Research Council’s guidelines for managing risks in recreational water (NHMRC 2008) were adopted for use in New South Wales in May 2009. These guidelines have been adopted in all Australian states and territories and are supported by guidance notes developed by the Department of Health Western Australia (WA Department of Health 2007).

### Enterococci

**The national guidelines advocate the use of enterococci as the single preferred faecal indicator in recreational waters.**

These bacteria are excreted in faeces and are rarely present in unpolluted waters. Enterococci have shown a clear dose–response relationship to disease outcomes in marine waters in the northern hemisphere. In accordance with the guidelines, Beachwatch tests for enterococci only. The enterococci density in water samples is analysed in the laboratory using method AS/NZS 4276.9:2007 (Standards Australia 2007).

Enterococci are measured in colony forming units per 100 mL of sample (cfu/100 mL).

Beach Suitability Grades are determined by using the following matrix:

		Microbial Assessment Category			
		A	B	C	D
Sanitary Inspection Category	Very Low	Very Good	Very Good	Follow Up	Follow Up
	Low	Very Good	Good	Follow Up	Follow Up
	Moderate	Good	Good	Poor	Poor
	High	Good	Fair	Poor	Very Poor
	Very High	Follow Up	Fair	Poor	Very Poor

\* Follow up occurs when sanitary inspection and water quality data produce potentially incongruent results; further assessment will be required.

Using the Beach Suitability Grade classification matrix, sites assigned a moderate Sanitary Inspection Category can only be rated as Good or Poor, with no option of Fair grades. This can create the impression of a large change in water quality when in fact there need only be a slight increase in bacterial counts to push it over the threshold, with no significant increase in the risk to public health.

## Microbial Assessment Category (MAC)

There are 4 Microbial Assessment Categories (A to D) and these are determined from the 95th percentile of an enterococci dataset of at least 100 data points. Each MAC is associated with a risk of illness determined from epidemiological studies. The risks of illness shown below are not those associated with a single data point but are the overall risk of illness associated with an enterococci dataset with that 95th percentile (Wyer et al. 1999).

### Risk of illness associated with Microbial Assessment Categories

Category	Enterococci (cfu/100 mL)	Illness risk*
A	≤40	GI illness risk: <1% AFR illness risk: <0.3%
B	41–200	GI illness risk: 1–5% AFR illness risk: 0.3–1.9%
C	201–500	GI illness risk: >5–10% AFR illness risk: >1.9–3.9%
D	>500	GI illness risk: >10% AFR illness risk: >3.9%

\* GI = gastrointestinal illness; AFR = acute fever and rash

### Calculating the MAC

The 95th percentile is a useful statistic for summarising the distribution of enterococci data at a site. It embodies elements of both the location of the distribution (how high/low the enterococci counts are) and the scale of the distribution (how variable the enterococci counts are).

The 95th percentile values for each of the 4 Microbial Assessment Categories were determined by the World

Health Organization using enterococci data collected from swimming locations across Europe. These values will represent different probabilities of illness if the distribution of enterococci data from swimming locations in New South Wales differs from the European distribution.

In recognition of this issue, Dr Richard Lugg (Department of Health, Western Australia) has developed a Microsoft® Excel tool for calculating a modified 95th percentile that takes into account the distribution of data. The WA Department of Health recommends a minimum of 65 samples, collected from a particular site over 5 consecutive years, to provide sufficient confidence and reliability in the 95th percentile data output. This tool has been used to calculate the 95th percentile values presented in this report and has been adopted for use by other state governments in Australia.

The tool can be downloaded from the WA Government's 'Environmental waters publications' webpage, under *Forms and templates*.

## Sanitary Inspection Category (SIC)

More information about the **sanitary inspection** process is available in the Beachwatch Protocol for assessment and management of microbial risks in recreational waters, found on the department's website.

The aim of a sanitary inspection is to identify all sources of faecal contamination that could affect a swimming location and assess the risk to public health posed by these sources. It is an assessment of the likelihood of bacterial contamination from identified pollution sources and should, to some degree, correlate with the bacterial water quality results obtained from sampling.

The main sources of faecal contamination considered in the sanitary inspection are: bathers, toilet facilities, wastewater treatment plants (WWTPs), sewage overflows, sewer chokes, onsite systems, wastewater re-use, stormwater, river discharge, lagoons, boats and animals.

Rivers, lakes and estuaries themselves can be potential sources of faecal contamination to sites located in these waterbodies, with contaminated water from upstream or surrounding areas impacting water quality at the swimming location. This source is captured in river discharge or lagoon category and shown as the waterbody in the sanitary inspection charts.

Through the sanitary inspection process, beaches are categorised to reflect the overall likelihood of faecal contamination. There are 5 categories: Very Low, Low, Moderate, High and Very High.

Stormwater drain flow  
Photo: Beachwatch/DPE

Stormwater in urban areas often contains sewage from leakages, overflows or sewer chokes when the sewerage system fails.

Sewage overflows can occur in wet weather when the network has exceeded capacity due to rainwater entering the system. The mix of sewage and rainwater discharges from designated overflow points and drains to waterways, usually via the stormwater system. Overflows from the sewerage system can also occur in dry weather due to mechanical failure or power outage.

Sewer chokes occur due to blockages in the pipes usually due to tree roots, oil, grease or debris. This causes sewage to back up and escape via sewer inspection points, designed overflow structures or cracks in the pipes, then drain to waterways, usually via the stormwater system.

## Explanation of tables

Each region contains tables listing all monitored swimming sites including site type, beach grade and change in grade from the previous year.

The following symbols are used to show the change in beach grade from the previous year:

- Stable
- ↑ Improved
- ↓ Declined

A provisional grade indicates the assessment is based on limited data collected during the assessment period and should not be compared to the beach grade from the previous year.

## Explanation of graphs, charts, and information bars on beach pages

### Microbial Assessment Category (MAC) chart

On each beach page, the MACs for the last 5 years are displayed on a simple bar chart. The MAC for the current year is based on enterococci data collected during the assessment period. The bars are labelled with the 95th

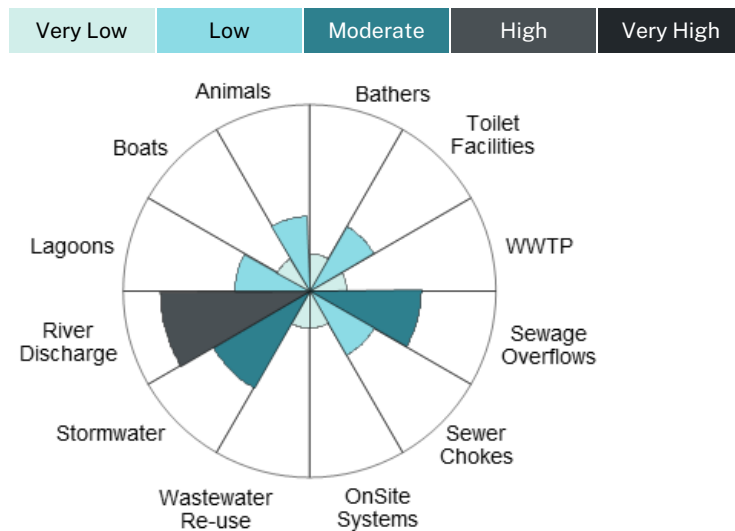

percentile value for each year and the thresholds dividing the A, B, C and D categories are marked in green, amber and red for reference.

### Sanitary Inspection Category (SIC) chart

The results of the sanitary inspection for each swimming location are presented in a radar pie chart. The chart shows the likelihood that each identified pollution source will contribute to faecal contamination at a swimming site, as indicated by the size and colour of the segment, ranging from very low (lightest colour) to very high (darkest colour) as shown below. The sum of these contributions is the overall likelihood, or Sanitary Inspection Category.

### Wet and dry weather water quality chart

Enterococci levels in wet and dry weather conditions are presented for each swimming location as a bar graph. All data collected during the assessment period is included in the analysis. Dry weather is defined as no rainfall recorded in the previous 24 hours. Each bar is colour coded to show the number of enterococci results up to 40 cfu/100 mL, between 41 and 200 cfu/100 mL, between

201 and 500 cfu/100 mL and greater than 500 cfu/100 mL. These categories reflect the Microbial Assessment Category thresholds and are coloured on the graph as dark green, light green, amber and red respectively.

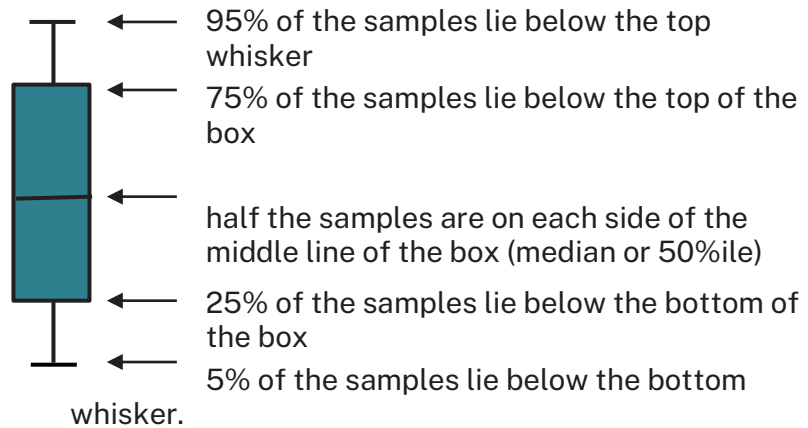

It is expected that swimming sites with lower levels of flushing will show some elevated bacterial results in dry weather samples (no rainfall in the previous 24 hours) due to the longer time needed to recover from a rainfall event. At some estuarine and lake/lagoon swimming locations the impacts of stormwater pollution on beach water quality may be detected up to 3 days after rainfall.

### Water quality in response to rainfall

Trends in enterococci levels in response to rainfall are shown using a box plot. For reference, enterococci levels of 40 cfu/100 mL and 200 cfu/100 mL are indicated with a green and orange line, respectively. The 40 cfu/100 mL level is referred to as the ‘safe swimming limit’. The enterococci data were obtained from the last 5 years of monitoring. Rainfall data were obtained from rain gauges situated close to the sample site and are 24-hour totals to 9 am on the day of sampling. If there are fewer than 5 enterococci data points in a rainfall category, individual data points are presented instead of a box plot. At sites where many results are below the detection limit (1 cfu/100 mL), only the upper portion of the box plots will be visible.

Each part of the box plot represents a significant percentile value of the sample population:

## Information bars

Information bars on each beach page provide a summary of details about the swimming site.

The **assessment period** shows the timeframe in which the water samples were collected. The NHMRC guidelines state beach grades should be determined from the most recent 100 water quality results collected within a 5-year period. The assessment period varies between sites depending on sampling frequency.

Dry weather samples suitable for swimming (**dry weather swimmability**) shows the percentage of water samples with enterococci levels below 40 cfu/100 mL. Dry weather is defined as no rainfall in the previous 24 hours.

Swimming sites with lower levels of flushing often have a lower percentage of dry weather samples within the safe swimming limit due to the impacts of rainfall detected up to 3 days after the event.

## Explanation of maps

A map of individual swimming locations is presented on each beach page. The scale of the maps is 1:10,000. Each map shows the location of the sampling site, land use and features such as surf lifesaving clubs. Potential pollution sources such as stormwater drains, sewage pumping stations, wastewater treatment plants, lagoons, rivers and creeks, are shown where accurate data is held.

Key to maps	
	Sampling Site
	Surf Life Saving Club
	Wastewater Treatment Plant
	Sewage Pumping Station
	Sewage Overflow
	Stormwater Drain
	Water
	Baths
	National Park/Reserve/ Other Park
	Built-up Area
	Sand
	Roads
	Major Roads
	Baths – Netted Area
	Breakwater/Wharf
